**CME Respiratory Medicine (125124): self-assessment questionnaire**

Edited by Tahmina A Chowdhury

SAGs and answers are ONLINE for BCP fellows and college students

Formal

Questions are asked to choose the best answer from the four possible answers. This test is for format is used in many of the examinations. However, the questions are not intended to be representative of those used in the MRCP(UK) Part 1 or Part 2 (Practical Examination).

The answering process

1 Go to [www.rcplondon.ac.uk/SAG](http://www.rcplondon.ac.uk/SAG)  
 2 Log on using your usual BCP username and password  
 3 Select the relevant CME question paper  
 4 Answer all 10 questions by selecting the best answer from the options provided  
 5 Once you have answered all the questions, click on Submit

Registering your estimated CPD credits

Calculating the CPD credits you receive from your CPD credits. These will be automatically transferred to your CPD diary, where you can review the activity and claim your points.

1. In a patient with acute cystitis, fluoroquinolones, after have every course of antibiotics in 1 year are long term antibiotics considered?

- (a) One or more
- (b) Two or more
- (c) Three or more
- (d) Four or more
- (e) Five or more

2. In which circumstances are inhaled corticosteroids recommended in patients with bronchitis?

- (a) In all bronchitis patients
- (b) In those with moderate asthma
- (c) In those with no evidence of acute disease
- (d) In those with no evidence of asthma
- (e) In those with no evidence of chronic obstructive pulmonary disease

3. Which of the following is the best choice of antibiotic used for long term inhaled prophylaxis against chronic Pseudomonas aeruginosa infection according to British Thoracic Society 2010 guidelines?

- (a) Amoxicillin
- (b) Ciprofloxacin
- (c) Colistin
- (d) Gentamicin
- (e) Tobramycin

4. A 62 year old man was found to have a 1.1 cm subpleural right lower lobe lung nodule with a small bronchovascular bundle. Contrast enhanced CT showed right para tracheal lymph node which was 13 mm in diameter but no other metastases. He had mild chronic obstructive pulmonary disease.

What is the following statement about the treatment options is the most accurate?

- (a) Active surveillance by PET should be offered and if the tumour increases in size after 12-18 months repeat PET should be performed.
- (b) Active surveillance by PET should be offered and if the tumour increases in size after 12-18 months repeat PET should be offered and if the tumour increases in size after 12-18 months repeat PET should be offered.
- (c) PET suggests a single node lymph node involvement, the patient should have surgery.
- (d) No surgical intervention is indicated if the tumour increases in size after 12-18 months repeat PET should be offered.
- (e) PET suggests a single node lymph node involvement, the patient should have surgery.

5. A 72 year old woman presented with right sided pleural effusion. A diagnostic ultrasound guided pleural aspiration was performed and a large rounded subpleural nodule with a CT of the chest revealed a right lung hilar mass with right and left paratracheal lymph node enlargement. A thoracotomy with biopsy (which confirmed metastatic adenocarcinoma of lung origin), dissection of the effusion, and left pleurodesis were performed.

What is the next step in further treatment?

- (a) Chemotherapy is not an option as cancer is too advanced
- (b) Systemic growth factor receptor gene therapy should be performed on the biopsy sample
- (c) Systemic growth factor receptor gene therapy should be performed on the biopsy sample
- (d) If the metastatic nodules, the patient should definitely have surgery
- (e) If the metastatic nodules, the patient should definitely have surgery

6. The patient should have EBUS to sample para tracheal lymph nodes
